

Welcome

Southern Maryland Rapid Transit (SMRT) Planning and
Environment Linkages (PEL) Study

Open House

SMRT Study

- A partnership between the Maryland Transit Administration (MTA), Charles County and Prince George's County
- Will evaluate rapid transit improvements along the study corridor
 - Approximately 19 miles along the MD 5 (Branch Avenue)/ US 301 (Crain Highway) corridor
 - Located between the Branch Avenue Metrorail Station in Prince George's County and the Waldorf-White Plains area in Charles County

Planning and Environment Linkages (PEL)

What is the PEL process?

Why use PEL?

Accelerated Project Delivery

Early Public & Stakeholder Involvement

Elimination of Duplicate Work

Better Communication

Environmental Inventory & Impacts Assessment

- Natural Environmental Resources
- Community Impact Analysis
- Statewide Air Quality Initiatives
- Noise
- Cultural Resources/Section 106
- Air Quality
- Reasonably Foreseeable Effects
- Hazardous Materials

Each discipline will build on the information from the 2017 Report by identifying existing conditions and by evaluating potential effects of the alternatives

Methodology

- Establish protocols for technical analysis

Data Gathering

- Desktop GIS data
- Fieldwork

Technical Report

- Existing conditions
- Potential impacts

Why is this project needed?

Lack of travel options, traffic congestion, and high crash rates result in **UNRELIABLE TRAVEL** for commuters throughout the corridor

Existing roadway experiences high traffic volumes **BEYOND ITS CAPACITY**

Existing transit options **DO NOT PROVIDE ADEQUATE TRANSIT SERVICE** to connect commuters to and from jobs

Various master plan documents have identified MD 5 and US 301 as a corridor along which **TRANSIT IMPROVEMENTS ARE NEEDED**

The highest average daily traffic volume of any arterial road in Maryland occurs in the SMRT Corridor.

Agency & Major Stakeholder Coordination

Interagency Working Group (IAWG)

- Provides review and comment specific to an agency
- Discusses regulated resources
- Discusses impacts, avoidance and minimization
- Provides input on study milestones, schedule, and progress
- Works towards a clear path for future approvals and permits
- *Members*
 - Lead Agencies (FTA & MTA), Cooperating and Participating Agencies

Technical Advisory Working Group (TAWG)

- Provides technical review
- Provides recommendations for development and evaluation of proposed improvements
- *Members*
 - WMATA
 - Joint Base Andrews (JBA)
 - IPC Members
 - Tri-County Council for Southern Maryland (TCCSMD)
 - MWCOG
 - MedStar Southern Maryland Hospital Center
 - MDP
 - Maryland-National Capital Park & Planning Commission (M-NCPPC)

Intergovernmental Project Committee (IPC)

- Guides implementation of the Framework Agreement
- Provides PEL study oversight
- Provides issue resolution support
- Decision-making ability
- *Members*
 - MDOT TSO
 - Prince George's County
 - MTA
 - Charles County
 - SHA

Visit SMRTmaryland.com to view the SMRT draft Agency Coordination Plan

SMRT Alternatives Overview

Bus Options

- **Alternative 1: Arterial Rapid Transit (formerly Alternative 2D)**
 - Enhancements of commuter bus service to provide all-day, bi-directional and reverse commute connectivity and intersection bus priority treatments
- **Alternative 2: Bus Rapid Transit (BRT)**
 - Within the MD 5/US 301 roadway
- **Alternative 3: Bus Rapid Transit (BRT)**
 - On separated guideway

Rail Options

- **Alternative 4: Light Rail Transit (LRT)**
 - On separated guideway
- **Alternative 5: Hybrid Rail (YR)**
 - On separated guideway

Station Typology

Multimodal Mixed-Use

Design Priorities

- Enable the density, mix of uses, walkability and quality public spaces to make the station a focal point for the local community
- Secondary focus on facilitating ease of transfers between SMRT and other transit

Access Features

- High-quality pedestrian amenities
- Garage parking serving transit and mixed-use development
- Bus bays located adjacent to SMRT platform, potentially within garages
- Safe bike routes & protected bike parking
- Linear kiss & ride on street or in garage

Land Use

- Near-term opportunity for TOD supported by local regulations
- Commercial/Retail closest to station

Neighborhood

Design Priorities

- Smaller station footprint
- Mesh with the surrounding community
- Thematic design elements to create sense of place

Access Features

- High-quality, ADA-friendly pedestrian amenities featuring excellent lighting
- Limited number of on-street bus bays
- Safe bike access routes and protected bike parking facilities adjacent to platform

Land Use

- Existing patterns predominate in the near-term
- Stations designed to support future TOD opportunities

Collector/Connector

Design Priorities

- Focus on ease of transfer between modes

Access Features

- High-quality pedestrian amenities featuring gathering spaces, excellent lighting
- Kiss & ride, park & ride with direct access to station
- Bus bays facilitating transfers to SMRT & between routes
- Safe bike access routes and protected bike parking facilities
- Adherence to access facilities hierarchy

Land Use

- Existing patterns predominate in the near-term
- Stations designed to support future TOD opportunities

Potential Station Types and Locations

Station	Multimodal Mixed-Use	Neighborhood	Collector/Connector
Branch Avenue	●		●
Joint Base Andrews		●	
Camp Springs		●	
Coventry		●	
Woodyard		●	
Surratts	●		
Brandywine			●
Timothy Branch	●		
Mattawoman		●	
Acton	●		
Waldorf		●	
Smallwood			●
White Plains			●

Key Features

High quality pedestrian amenities and quality public spaces to make the station a focal point for the surrounding community.

Smaller station footprint and integration with surrounding community. Existing land use patterns predominate in the near term.

Focus on ease of transfer between modes with high quality infrastructure such as bus bays and park and ride lots.

*The Alternative 1 station locations are not shown on this map, as they are fewer in number and at different locations than those for Alternatives 2-5. Please refer to the Alternative 1 board for station locations.

Progress Since June Open Houses

Common themes and concerns gleaned from June Open Houses

- **Support for near term solutions**

A significant number of participants voiced a preference for bus or other solutions that could be implemented sooner than rail options to address congestion issues

- **Pedestrian and cyclist safety**

Participants emphasized the importance of incorporating features that protect non-motorized users in the design of any transit alternatives chosen

- **Future development and parking**

Participants expressed interest in how rapid transit alternatives could support and enhance surrounding Transit Oriented Development (TOD) and how TOD around potential station areas could help to reduce the current burden on infrastructure

Interim actions since Open Houses

- **Dropped Old Washington Rd. in Waldorf**

Minimal travel time impacts and inconsistent with current efforts to redesign the street

- **Dropped HOV lane as an option from Alt 2B**

Due to the targeted nature of improvements associated with Alt. 2, HOV lanes would be non-continuous along the corridor; they were therefore considered impractical and were dropped

- **Added Alt 1 (Arterial Rapid Transit)**

Creates a shorter-term improvement to transit in the corridor

Evaluation of Preliminary Alternatives

- **Developed Evaluation Criteria**

Evaluation Criteria ensure Purpose and Need of PEL Study are met

- **Station location refinement**

Range of station locations refined to best serve transit users and traffic operations, and to minimize impacts

- **Conducted Alternatives Screening Process**

Applied the evaluation criteria using the evaluation metrics/ methodology to identify a comparative range of costs, ridership, and impacts

Alternative 1 – Arterial Rapid Transit

Alternative Description

Alternative 1 includes an Arterial Rapid Transit bus route along the MD 5/US 301 corridor along with some spot bus priority treatments (e.g. Transit Signal Priority (TSP) and queue jumps) to reduce delays. Improvements would also include all-day, bi-directional service.

The buses would operate primarily in mixed traffic conditions.

Mixed Traffic with Bus Priority Treatments

Types of Bus Priority Treatments

Alternative 1 – Arterial Rapid Transit

Alternatives Summary

Benefits

- Provides all-day, bi-directional and reverse commute connectivity
- Increases transit ridership along the corridor by 2,500-3,500 passengers per day
- Spot bus priority treatments (e.g. Transit Signal Priority (TSP) and queue jumps) to reduce transit travel times to 55-70 minutes
- Lowest project impacts, capital costs (\$10-\$50 million), and implementation timeline (1-2 year construction period) by leveraging the existing road network and transit facilities
- Would provide an opportunity to serve as an interim improvement condition while design/funding advances on a preferred alternative

Considerations

- Lowest ridership
- Least competitive with auto travel time
- Least frequent service
- Fewer new station amenities and less branding

Similar Systems

Denver, CO – Flatiron Flyer

Jacksonville, FL – First Coast Flyer

Montgomery County, MD – FLASH

Alternative 2 includes Bus Rapid Transit in the roadway of the existing MD 5/US 301 corridor and includes Transit Signal Priority (TSP) to reduce bus delay at traffic signals.

The northern portions of the corridor will include sections in mixed traffic and dedicated bus lanes in the most congested areas, while the southern portion would feature a median bus transitway. This alternative includes significant widening of the MD 5/US 301 roadways throughout the corridor.

Alternative 2: BRT in Roadway

Alternatives Summary

Benefits

- Increases transit ridership along the corridor by 3,000-5,500 passengers per day
- Combination of dedicated bus lanes and median guideway reduces transit travel times to 45-55 minutes
- High transit service flexibility to add service and/or modify routing
- Lower environmental, community, and cultural impacts with an implementation timeline that includes a construction period of 2-6 years

Considerations

- Buses would operate in segments of mixed traffic resulting in some reductions in reliability
- Station connectivity would require some grade-separated pedestrian crossings due to station locations
- Highest number of business/commercial properties with partial impacts due to median transitway alignment
- Capital costs of \$2.0-\$3.0 billion

Similar Systems

Montgomery County, MD

University Blvd Dedicated Lanes

RideOn extRa Stop Amenities

Cleveland, OH – RideRTAHealthLine

Seattle, WA – Rapid Ride

Alternative 3: BRT in Separated Guideway

Alternative Description

Alternative 3 includes Bus Rapid Transit (BRT) in an exclusive separated guideway east of the MD 5/US 301 corridor and includes Transit Signal Priority (TSP) and/or preemption to minimize bus delay at traffic signals.

The northern portions of the corridor will be adjacent to MD 5/US 301, while the southern portion would follow alongside the existing Pope's Creek Rail Line through Waldorf.

Exclusive Separated BRT Guideway

Exclusive Separated BRT Guideway

Alternative 3: BRT in Separated Guideway

Alternatives Summary

Benefits

- Higher transit ridership along the corridor with an increase of 8,500-12,500 passengers per day
- Exclusive guideway provides the lowest bus travel times from 30-45 minutes with high travel time reliability
- Reduced Operating & Maintenance cost compared to rail-based alternatives
- Moderate transit service flexibility to add service and/or modify routing
- Station locations more centralized and no grade-separated pedestrian bridges are required

Considerations

- High number of residential and business/commercial property displacements and residential partial property impacts
- Higher environmental, community, and cultural impacts
- Longer implementation timeline with a construction period of 5-8 years
- High-cost alternative at \$4.0-\$5.0 billion

Similar Systems

Fort Collins, CO - MAX BRT

Connecticut - CTfastrak

Los Angeles, CA - G Line

Alternative 4: LRT in Separated Guideway

Alternative Description

Alternative 4 includes Light Rail Transit (LRT) vehicles in an exclusive separated guideway east of the MD 5/US 301 corridor and includes preemption to minimize delay at traffic signals.

The northern portions of the corridor will be adjacent to MD 5/US 301, while the southern portion would follow alongside the existing Pope's Creek Rail Line through Waldorf.

Exclusive Separated LRT Guideway

Exclusive Separated LRT Guideway

Alternative 4: LRT in Separated Guideway

Alternatives Summary

Benefits

- Highest transit ridership along the corridor with increases of 14,500-19,000 passengers per day
- Exclusive guideway provides the lowest travel times from 30-40 minutes with high travel time reliability
- Station locations more centralized and no grade-separated pedestrian bridges are required

Considerations

- Lowest transit service flexibility with limited ability to modify service
- Highest number of residential and business/commercial property displacements and residential partial property impacts
- Highest environmental, community, and cultural impacts
- Longest implementation timeline with a construction period of 7-9 years
- Highest cost alternative at \$5.5-\$6.5 billion in capital costs and \$20-\$28 million in annual operating and maintenance costs

Similar Systems

Charlotte, NC - Lynx

San Jose, CA- Light Rail

Baltimore, MD - Light RailLink

Alternative 5: Hybrid Rail

Alternative Description

Alternative 5 includes Hybrid Rail (YR) vehicles in an exclusive separated guideway east of the MD 5/US 301 corridor and includes preemption to minimize delay at traffic signals.

The northern portions of the corridor will be adjacent to MD 5/US 301, while the southern portion would repurpose the existing Pope's Creek Rail Line track through Waldorf and construct one additional track alongside.

Exclusive Separated Hybrid Rail Guideway

Exclusive Separated Hybrid Rail Guideway

Alternative 5: Hybrid Rail

Alternatives Summary

Benefits

- Second highest transit ridership along the corridor with increases of 14,500-19,000 passengers per day
- Exclusive guideway provides the lowest travel times from 30-40 minutes with high travel time reliability
- Station locations more centralized and no grade-separated pedestrian bridges are required
- No overhead catenary wires

Considerations

- Lowest transit service flexibility with limited ability to modify service
- High numbers of displacements and partial property impacts on residential and business/commercial properties
- Higher environmental, community, and cultural impacts
- Longest implementation timeline with a construction period of 7-9 years
- Second highest cost alternative at \$5.0-\$6.0 billion in capital costs and \$20-\$28 million in annual operating and maintenance costs

Similar Systems

New Jersey—River LINE

San Bernardino County, CA - Arrow

Dallas/Ft -Worth, TX—Silver Line

Sub-Option Alignment Evaluation

¹Base option includes an additional station/stop at Joint Base Andrews

²Cost reflects range of transit alternatives between Camp Springs and Branch Avenue Metro (2.7-mi)

¹Cost reflects range of transit alternatives between Woodyard Road to Spine Road (4.7-mi)

¹Sub-Option includes a flyover for southbound transit vehicles to access the hospital

²Cost reflects range of transit alternatives between Woodyard Road to Spine Road (4.7-mi)

¹Cost reflects range of transit alternatives between Timothy Branch Dr to Acton Ln 3.1-mi)

¹Cost reflects range of transit alternatives between Leonardtown Rd to Smallwood Dr (1.3-mi)

¹Cost reflects range of transit alternatives between Spine Rd to Sub-Station Rd (4.0-mi)

Impacts Matrix

SMRT Transit Alternatives	COMMUNITY/CULTURAL											NATURAL ENVIRONMENT							ENGINEERING	
	 Residential Properties Impacted	 Residential Property Displacements	 Business/Commercial Properties Impacted	 Business/Commercial Displacements	 Churches	 Schools	 Cemeteries	 Parks (No.)	 Healthcare Facilities	 Community Services and Facilities	 Historic Properties (No.)	 Hazardous Material Sites	 New Stream Crossings**	 Existing Stream Crossings**	 Wetlands (Acres)	 100-Year FEMA Floodplain (Acres)	 DNR HCN (hubs and corridors) (Acres)	 Woodlands (Acres)	 Length of Segment (Miles)	 Length of Structures (LF) (New or Widened Bridges)

^Least Highest^

¹Corridor travel time estimates between Branch Ave Metro (Auth Way) and Waldorf (Demarr Road) in the peak hour and direction (Northbound AM and Southbound PM)

²Operating and maintenance costs are limited to the mainline alternative and do not account for changes to locally operated transit services locally operated transit services

³Construction is contingent upon completion of the design phase, securing project construction funding, and acquiring needed right-of-way

⁴Total transit person trips traveling along the SMRT study Corridor. For reference, the current transit ridership along the corridor is ~1,000 passengers per day as of July-September 2025.

⁵Symbols are provided for resource impacts having the highest magnitude relative to the other alternatives

Capital Investment Grants (CIG)¹ Funded Project Comparison

Mode	Project	Metro Area	Length (mi)	Total Cost ² (\$Mil)	Cost ² (\$Mil) / Mile	Daily Ridership	Ridership / Mile
